16
        }
```

获取活动详细信息

```
1
 2
         * @param activityId 活动的id
 3
         * @return 返回ActivityDetail的json串,如果没有找到对应的活动详细信息则返回空串""
         * @description 获取活动详细信息
 4
 5
        */
        @RequestMapping("/getActivityDetail")
 6
 7
        public String getActivityDetail(Integer activityId) {
 8
            if (activityId == null) {
 9
                System.out.println("getActivityDetail Error");
                return "ErrorParameter";
10
11
            }
12
            String activityDetail =
    activityService.getActivityDetail(activityId);
13
            return activityDetail != null ? activityDetail : "";
14
        }
```

判断是否收藏

```
/**
 1
 2
         * @param id
                             用户id,注意不是getUserId,是getId
 3
         * @param activityId 活动的id
 4
         * @return 返回true或者false的字符串
 5
         * @description 判断是否收藏
 6
         */
 7
        @RequestMapping("/judgeCollected")
 8
        public String judgeCollected(Integer id, Integer activityId) {
9
            if (id == null || activityId == null) {
                System.out.println("judgeCollected Error");
10
11
                return "ErrorParameter";
12
            }
13
            boolean flag = activityService.judgeCollected(id, activityId);
14
            return flag ? "true" : "false";
        }
15
```

获取收藏的活动列表

```
1
2
                         用户id,注意不是getUserId,是getId
        * @param id
3
        * @param pageNum 页码
4
        * @param pageSize 页大小
5
        * @return 返回List<UserCollectActivity>集合,如果没有就返回"empty"
6
        * @description 获取收藏的活动列表
7
        */
8
        @RequestMapping("/getCollectedActivities")
9
        public String getCollectedActivities(Integer id, Integer pageNum,
    Integer pageSize) {
10
           if (id == null || pageNum == null || pageSize == null) {
11
                System.out.println("getCollectedActivities Error");
12
                return "ErrorParameter";
13
            }
            return activityService.getCollectedActivities(id, pageNum,
14
    pageSize);
15
       }
```

添加活动

```
1
      /**
                               客户端传递若干MultipartFile文件,要求请求的参数名
2
       * @param files
   字都
                               是file(就是要重复),这边接收就是自动加入
3
   List<MultipartFile>中
       * @param activityDetailJson 客户端将封装好的ActivityDetail类转换为Json串发送
4
   过来,
5
                               注意ActivityDetail里面的Activity类也得把数据都
   封装好,
6
                               添加操作,不需要设置id值,因为数据库id是自增的
7
       * @return 返回一个添加成功或者失败"true"或者"false"
       * @description 添加活动,接受一个ActivityDetail类的Json串数据,且参数名称为
   activityJson
       */
9
      @RequestMapping("/addActivity")
10
```

```
public String addActivity(@RequestParam("file") List<MultipartFile>
11
    files, String activityDetailJson) {
            if (activityDetailJson == null) {
12
13
                System.out.println("addActivity Error");
14
                return "ErrorParameter";
15
            }
            return activityService.addActivity(files, activityDetailJson) ?
16
    "true" : "false";
17
        }
```

获取报名的活动列表

```
1
 2
                          用户id,注意不是getUserId,是getId
         * @param id
 3
         * @param pageNum 页码
         * @param pageSize 页大小
 5
        * @return 返回List<UserCollectActivity>集合,如果没有就返回"empty"
 6
         * @description 获取报名的活动列表
 7
         */
 8
        @RequestMapping("/getEnterActivities")
